# Lead *Blockchain* Infrastructure Engineer

**Location:** Remote / Poland (International Team)
**Employment Type:** Full-time / Contract
**Reports To:** Chief Technology Officer / Head of Engineering

## About the Company

Plaid is a financial technology company that provides infrastructure connecting financial applications with banks and financial institutions. Its technology supports secure financial data access, account verification, identity verification, and payment services.

Our team is planning to establish a new software development company in Poland, focusing on fintech, payment infrastructure, and *blockchain*-based financial products.

Our planned projects cover real estate marketplaces, gaming, sports betting, and *Web3* social finance platforms. We aim to combine traditional financial technologies with *blockchain* infrastructure to support digital payments, *wallet* integrations, transaction processing, *smart contract*s, and decentralized financial services.

We are building an international engineering team and looking for experienced technical leaders who can help shape our products from an early stage.

## About the Role

We are looking for an experienced **Lead *Blockchain* Infrastructure Engineer** to design, build, and maintain secure, scalable *blockchain* infrastructure for our *Web3* fintech and payments products.

This is a hands-on technical leadership role. You will take ownership of *blockchain* integrations, transaction processing services, RPC infrastructure, *blockchain* data in*dex*ing, and the backend systems connecting our applications to *blockchain* networks.

You will work closely with backend engineers, *smart contract* developers, DevOps engineers, and product teams to *defi*ne technical architecture, develop critical services, and improve the performance, reliability, and security of our platform.

We need someone who enjoys writing production code while also guiding engineering decisions and helping other developers deliver high-quality solutions.

## What You'll Do

- Lead the architecture and development of *blockchain* infrastructure supporting financial transactions and *Web3* applications.
- Build and maintain backend services that communicate with *blockchain* networks through RPC, WebSocket, and other interfaces.
- Design transaction processing systems for payments, deposits, withdrawals, settlement, and digital asset transfers.
- Develop *blockchain* in*dex*ing services to process blocks, transactions, *smart contract* events, and *wallet* activity.
- Build scalable APIs and microservices connecting *blockchain* networks with traditional backend applications.
- Integrate *EVM*-compatible networks and other *blockchain* ecosystems based on product requirements.
- Develop reliable transaction monitoring, confirmation tracking, retry, and reconciliation mechanisms.
- Improve *blockchain* infrastructure performance, availability, security, and operational efficiency.
- Design event-driven systems and asynchronous processing pipelines for high-volume *blockchain* data.
- Collaborate with *smart contract* engineers to integrate contracts with backend services.
- Establish monitoring, logging, alerting, and incident response practices for *blockchain* services.
- Participate in architecture discussions, technical planning, code reviews, and production troubleshooting.
- Mentor engineers, *defi*ne coding standards, and guide technical implementation across the team.
- Remain hands-on with development, testing, debugging, and deployment of critical infrastructure.

## Required Skills & Experience

- 6+ years of professional software engineering experience, including substantial backend or distributed systems development.
- 3+ years of hands-on *blockchain* infrastructure or *Web3* backend engineering experience.
- S*tron*g programming experience with **Go or *Rust***.
- Solid knowledge of *Ethereum*, *EVM*-compatible networks, or other production *blockchain* ecosystems.
- Experience building *blockchain*-connected services, transaction processors, in*dex*ers, RPC integrations, or similar infrastructure.
- S*tron*g understanding of *blockchain* transactions, blocks, confirmations, *smart contract* events, *wallet*s, and digital asset transfers.

- Experience with distributed systems, microservices, concurrent programming, and asynchronous processing.
- S*tron*g knowledge of PostgreSQL, Redis, or similar data storage technologies.
- Experience designing and building REST APIs, gRPC services, or WebSocket-based systems.
- Hands-on experience with Docker, Kubernetes, AWS, GCP, or similar cloud infrastructure.
- Understanding of security practices for financial services, *blockchain* infrastructure, and transaction processing.
- Experience diagnosing performance problems, improving service reliability, and operating production systems.
- Ability to make technical architecture decisions, review code, and mentor other engineers.
- S*tron*g communication skills and experience collaborating with distributed teams.

# Nice to Have (Differentiators)

- Experience with *blockchain* execution clients such as G*eth*, Erigon, R*eth*, or N*eth*ermind.
- Experience with Layer 2 networks, rollups, bridges, or cross-chain transaction infrastructure.
- Familiarity with *Solana*, TON, Cosmos SDK, or other non-*EVM* ecosystems.
- Experience with *DeFi* protocols, decentralized exchanges, liquidity systems, or *trading* infrastructure.
- Knowledge of *Solidity* and *smart contract* integration.
- Experience building high-throughput RPC gateways, *blockchain* nodes, or real-time in*dex*ing services.
- Familiarity with Kafka, RabbitMQ, NATS, or other event-streaming technologies.
- Experience with *blockchain* security monitoring, transaction screening, or fraud detection systems.
- Knowledge of *blockchain* transaction lifecycle management, nonce handling, gas estimation, and reorganization recovery.
- Experience with payment gateways, fintech platforms, *wallet* infrastructure, or digital asset custody systems.
- Familiarity with Terraform, Prom*eth*eus, Grafana, OpenTelemetry, and automated deployment pipelines.
- Previous experience leading a small engineering team or establishing infrastructure for an early-stage product.

# Lead-Level Expectations

As Lead *Blockchain* Infrastructure Engineer, you will be expected to:

- Own the technical architecture of our *blockchain* infrastructure and critical transaction services.
- Make practical decisions about technology selection, scalability, security, and system reliability.
- Remain actively involved in coding and solving complex engineering problems.
- Guide backend and *blockchain* engineers through code reviews, technical discussions, and mentoring.
- Establish engineering standards for testing, documentation, monitoring, and deployment.
- Work closely with product and engineering leadership to translate business requirements into technical solutions.
- Identify infrastructure risks early and develop solutions before they affect production.
- Support the growth of the engineering team as our Poland operations expand.

This is not a purely managerial position. We expect s*tron*g hands-on engineering contributions alongside technical leadership.

# Example Problems You'll Work On

### ***Blockchain*** **Transaction Processing**

Design services that create, submit, monitor, and reconcile *blockchain* transactions while handling failures, retries, confirmations, and chain reorganizations.

### **Payment and Settlement Infrastructure**

Build *blockchain*-connected services supporting deposits, withdrawals, digital asset transfers, payment status tracking, and settlement workflows.

### ***Blockchain*** **Data In*dex*ing**

Develop efficient in*dex*ing pipelines that process *blockchain* events and make transaction data available to internal applications and financial dashboards.

### **Cross-Chain Integrations**

Integrate multiple *blockchain* networks and design reliable interfaces for applications operating across different ecosystems.

**Performance and Reliability**

Improve RPC efficiency, transaction processing latency, service availability, monitoring, and scalability as transaction volumes increase.

**Security and Risk Controls**

Implement secure infrastructure practices, transaction monitoring, access controls, and operational safeguards for systems handling digital assets.

# Why This Role Matters

Blockchain infrastructure will be an important technical foundation for our planned Web3 fintech and payments products.

As Lead Blockchain Infrastructure Engineer, you will help establish the architecture and engineering standards that support secure financial transactions, reliable blockchain integrations, and scalable applications.

You will have the opportunity to influence technical direction from an early stage, take ownership of critical infrastructure, and help build an international engineering team as we establish our software development operations in Poland.

We are looking for someone who combines strong hands-on engineering skills with practical technical leadership and enjoys building reliable systems that solve real financial technology problems.
