Senior *Web3* Full Stack Engineer — *Web3* Fintech & Payments

Location: Remote / Poland (International Team)
Employment Type: Full-time / Part-time / Contract
Reports To: Engineering Lead / Head of Engineering
Level: Senior Engineer (Hands-on Technical Role)

About the Company

Plaid is a financial technology company that provides infrastructure connecting financial applications with banks and financial institutions. Its technology supports secure financial data access, account verification, identity verification, and payment services.

Separately, we are planning to establish a new software development company in Poland, focusing on fintech, payment infrastructure, and *blockchain*-based financial products.

Our planned projects cover real estate marketplaces, gaming, sports betting, and *Web3* social finance platforms. We aim to combine traditional financial technologies with *blockchain* infrastructure to support digital payments, *wallet* integrations, transaction processing, *smart contract*s, and decentralized financial services.

We are building an international engineering team and looking for experienced engineers who can contribute to our products from an early stage.

About the Role

We are looking for an experienced **Senior *Web3* Full Stack Engineer** to design, develop, and maintain modern web applications that integrate traditional financial services with *blockchain* technology.

This is a hands-on engineering position that combines frontend development, backend services, *Web3* integrations, and practical software architecture.

You will work closely with *blockchain* engineers, backend developers, product designers, and product managers to build secure, scalable, and reliable applications.

Your responsibilities will include developing *wallet*-connected interfaces, building backend APIs, integrating *smart contract*s, and implementing transaction-processing workflows.

You will contribute to applications involving payments, digital assets, decentralized finance, gaming, and social finance.

We are looking for someone who can independently develop complete product features, make sound technical decisions, and deliver production-ready software.

This is not a purely frontend, backend, or *smart contract* engineering position. The role focuses on building complete *Web3* applications, from user interfaces to backend and *blockchain* integrations.

What You'll Do

Full Stack Application Development

- Design, develop, and maintain modern web applications using React, Next.js, TypeScript, and Node.js.
- Build responsive, accessible, and high-performance frontend interfaces.
- Develop scalable backend services using Node.js, NestJS, Express.js, or similar frameworks.
- Build and maintain REST APIs, GraphQL services, and real-time application integrations.
- Develop reusable components, shared libraries, and modular application architectures.
- Implement authentication, authorization, session management, and secure application workflows.
- Optimize frontend performance, backend response times, and database queries.
- Work with PostgreSQL, Redis, MongoDB, or other appropriate data technologies.
- Take ownership of complete application features from design through deployment and maintenance.

Web3 & *Blockchain* Integrations

- Develop decentralized application features connecting web interfaces with *blockchain* networks.
- Integrate applications with *Ethereum* and *EVM*-compatible networks.
- Build *wallet* integrations using *Eth*ers.js, Viem, Wagmi, *Wallet*Connect, or similar tools.
- Implement *wallet* connection, network switching, transaction signing, and *blockchain* transaction tracking.
- Integrate frontend and backend services with *Solidity smart contract*s.
- Develop functionality supporting *token* transfers, *wallet* balances, digital assets, and *blockchain* events.
- Work with *blockchain* engineers to implement reliable *smart contract* interactions.
- Support *blockchain* in*dex*ing, event monitoring, and transaction data synchronization.
- Investigate failed transactions, RPC errors, delayed confirmations, and network-related issues.

- Contribute to multi-chain applications where required by product needs.

Fintech & Payments Engineering

- Develop application features supporting financial transactions, digital payments, and digital asset management.
- Integrate payment gateways, financial APIs, and *blockchain* payment services.
- Build workflows for deposits, withdrawals, transfers, refunds, and transaction status tracking.
- Implement reliable transaction histories and financial dashboards.
- Connect off-chain backend systems with on-chain financial activity.
- Design appropriate handling for duplicate requests, failed transactions, retries, and transaction reconciliation.
- Integrate authentication, identity verification, and KYC services where required.
- Collaborate with security and backend teams to protect financial data and transaction workflows.

Frontend Architecture & User Experience

- Build *wallet*-connected dashboards and financial application interfaces.
- Implement clear loading, pending, successful, and failed transaction states.
- Develop reusable UI components and consistent frontend architecture.
- Manage application state using Redux, Zustand, TanStack Query, or equivalent tools.
- Integrate REST APIs, GraphQL services, and WebSockets into frontend applications.
- Collaborate with designers to make complex *blockchain* functionality understandable to users.
- Improve accessibility, responsiveness, and performance across devices.

Backend Systems & Infrastructure

- Develop modular backend services and APIs supporting *Web3* applications.
- Implement asynchronous processing, background jobs, queues, and event-driven workflows.
- Integrate external *blockchain* data providers, RPC services, and financial APIs.
- Design database models supporting transactions, users, assets, and application activity.
- Use Docker, cloud infrastructure, and CI/CD pipelines to deploy and maintain applications.
- Monitor production services and investigate reliability or performance problems.
- Work with DevOps engineers to improve scalability, availability, and deployment processes.

Testing, Security & Code Quality

- Write clean, maintainable, and well-documented production code.
- Develop unit tests, integration tests, and end-to-end tests.
- Use Jest, Vitest, Playwright, Cypress, Hardhat, or equivalent tools where appropriate.
- Review code and contribute to engineering best practices.
- Apply secure coding practices for authentication, authorization, API communication, and *blockchain* integrations.
- Work with *blockchain* engineers to ensure safe *smart contract* interactions and transaction authorization.
- Participate in technical planning, architecture discussions, and troubleshooting.
- Support other engineers through code reviews and technical knowledge sharing.

Required Skills & Experience

- 5+ years of professional software engineering experience.
- 2+ years of practical *Web3*, *blockchain* application, or decentralized application development experience.
- S*tron*g proficiency in **TypeScript and JavaScript**.
- Professional experience with **React and Next.js**.
- S*tron*g backend development experience with **Node.js, NestJS, Express.js**, or equivalent technologies.
- Experience developing full-stack applications used in production.
- S*tron*g understanding of REST APIs, GraphQL, asynchronous programming, and modern application architecture.
- Hands-on experience with *Ethereum* or *EVM*-compatible *blockchain* integrations.
- Experience with *Eth*ers.js, Viem, Wagmi, *Web3*.js, or similar *blockchain* libraries.
- Understanding of *wallet* connections, transaction signing, *blockchain* events, and *smart contract* interactions.
- Familiarity with *Solidity*, *smart contract* ABIs, and common *token* standards.
- Experience with PostgreSQL, Redis, MongoDB, or similar database technologies.
- Understanding of authentication, authorization, session management, and web security.
- Experience with Git, code reviews, automated testing, and CI/CD workflows.
- Familiarity with Docker and cloud deployment environments such as AWS or GCP.
- Ability to independently design, develop, test, and deploy complete application features.
- S*tron*g problem-solving skills and experience working with distributed engineering teams.
- Professional English communication skills.

Nice to Have (Differentiators)

- Previous experience in fintech, payments, *DeFi*, *blockchain* gaming, or SocialFi.
- Experience developing decentralized exchanges, *NFT* marketplaces, staking applications, or *Web3* financial dashboards.
- Hands-on *Solidity smart contract* development using Hardhat or Foundry.
- Familiarity with Layer 2 networks such as Arbitrum, Optimism, Base, Polygon, or zkSync.
- Experience integrating The Graph, *blockchain* in*dex*ers, or on-chain data APIs.
- Knowledge of cross-chain bridges, liquidity routing, *token swap*s, and interoperability protocols.
- Experience developing payment processing, escrow, refunds, or financial settlement workflows.
- Familiarity with account abstraction, smart *wallet*s, and multisignature transactions.
- Experience with event-driven systems using Kafka, RabbitMQ, or similar technologies.
- Experience with Kubernetes, Terraform, or cloud-native infrastructure.
- Knowledge of financial transaction reconciliation, idempotency, and distributed system reliability.
- Experience with React Native or mobile *Web3* applications.
- Familiarity with frontend design systems, Tailwind CSS, Storybook, or reusable component libraries.
- Experience integrating KYC, identity verification, or traditional financial services.
- Open-source contributions to *Web3* applications, frontend libraries, or developer tooling.
- Experience working in early-stage startups or developing new products from scratch.

Senior-Level Expectations

As a Senior *Web3* Full Stack Engineer, you will be expected to:

- Independently design and deliver complex full-stack application features.
- Take ownership of assigned services, frontend components, and *blockchain* integrations.
- Make practical architecture decisions that improve performance, scalability, and maintainability.
- Write secure and reliable production code.
- Understand how frontend applications, backend services, and *blockchain* networks interact.
- Identify technical risks early and propose effective solutions.
- Collaborate with *blockchain* engineers on *smart contract* integrations and financial transaction workflows.
- Review code and help less experienced engineers solve technical problems.
- Maintain s*trong* testing and documentation practices.
- Investigate production issues and implement lasting improvements.
- Balance software quality, performance, security, and product delivery requirements.
- Remain actively involved in hands-on development.

This is a senior individual contributor position. Formal people management is not required, but technical ownership and collaboration are important.

Example Problems You'll Work On

1. *Wallet*-Connected Financial Applications

Develop full-stack applications that allow users to connect *wallet*s, view balances, manage digital assets, and interact with *blockchain*-based financial services.

Implement secure *wallet* authentication, transaction authorization, and reliable backend integrations.

2. *Blockchain* Payment Processing

Build applications supporting *cryptocurrency* payments, deposits, withdrawals, and transaction tracking.

Connect frontend interfaces with backend transaction services and *smart contract*s.

Handle transaction status updates, retries, failed payments, and confirmation delays.

3. *Smart Contract* Integration

Develop application features that interact with *Solidity smart contract*s.

Implement m*eth*ods for reading contract state, submitting transactions, processing events, and updating application databases.

4. Financial Dashboards

Build dashboards that display transactions, *wallet* balances, digital assets, and payment activity.

Integrate backend APIs, *blockchain* data, and real-time updates to provide reliable financial information.

5. *DeFi* Application Features

Develop interfaces and backend services supporting *token swap*s, staking, rewards, and decentralized financial operations.

Collaborate with *smart contract* engineers to ensure safe and reliable integrations.

6. *Web3* Gaming Applications

Build *wallet*-connected gaming features involving digital assets, rewards, *NFT*s, and in-game financial transactions.

Integrate gaming-related functionality with backend services and *blockchain* networks.

7. Social Finance Platforms

Develop user-facing applications combining social interactions, *blockchain* identities, digital assets, and financial features.

Build APIs and interfaces supporting *wallet*-connected user profiles and decentralized application functionality.

8. Application Performance & Reliability

Optimize full-stack applications for performance, scalability, and production reliability.

Improve API efficiency, database queries, caching, *blockchain* integrations, and automated testing.

Why This Role Matters

As we establish our planned software development operations in Poland, full-stack engineering will be important to building complete fintech and *Web3* products.

Our applications will require modern user interfaces, reliable backend services, secure financial integrations, and practical connections to *blockchain* infrastructure.

The Senior *Web3* Full Stack Engineer will help bring these technologies tog*eth*er into applications that are reliable, scalable, and easy to use.

This position offers meaningful ownership of application features, backend services, frontend architecture, and *Web3* integrations.

You will work closely with experienced engineers, contribute directly to production development, and help establish s*tron*g engineering practices as our international team grows.

We are looking for an engineer who combines **s*tron*g React and TypeScript expertise, solid backend development skills, practical *Web3* experience, and an ability to deliver complete production-ready applications**.

Our goal is to build financial and *Web3* applications where complex technology is supported by secure, maintainable, and well-designed software.
