Senior *Web3* QA Automation Engineer — *Web3* Fintech & Payments

Location: Remote / Poland (International Team)
Employment Type: Full-time / Contract
Reports To: QA Lead / Head of Engineering
Level: Senior Engineer (Hands-on Technical Role)

About the Company

Plaid is a financial technology company that provides infrastructure connecting financial applications with banks and financial institutions. Its technology supports secure financial data access, account verification, identity verification, and payment services.

Separately, we are planning to establish a new software development company in Poland, focusing on fintech, payment infrastructure, and *blockchain*-based financial products.

Our planned projects cover real estate marketplaces, gaming, sports betting, and *Web3* social finance platforms. We aim to combine traditional financial technologies with *blockchain* infrastructure to support digital payments, *wallet* integrations, transaction processing, *smart contract*s, and decentralized financial services.

We are building an international engineering team and looking for experienced engineers who can help establish reliable testing processes, improve product quality, and contribute to development from an early stage.

About the Role

We are looking for an experienced **Senior *Web3* QA Automation Engineer** to design, develop, and maintain automated testing systems for our fintech, payments, and *blockchain*-connected applications.

This is a hands-on engineering position focused on test automation, *Web3* application testing, API validation, integration testing, and product reliability.

You will work closely with frontend engineers, backend developers, *blockchain* engineers, and product teams to ensure that our applications behave correctly across different environments and *blockchain* networks.

Your responsibilities will include building automated testing frameworks, validating *smart contract* integrations, testing financial transaction workflows, and improving the reliability of our release processes.

We are looking for someone who understands both traditional software testing and the additional challenges of *Web3* applications, including *wallet* connections, transaction confirmations, network failures, and *blockchain*-related edge cases.

This is not a purely manual testing role. Writing automation code and improving testing infrastructure will be central responsibilities.

What You'll Do

Test Automation & Quality Engineering

- Design, develop, and maintain automated testing frameworks for web applications, APIs, and *blockchain*-connected systems.
- Build end-to-end automated tests using Playwright, Cypress, Puppeteer, or similar frameworks.
- Develop reusable automation utilities, test fixtures, and testing components.
- Write automated tests using TypeScript or JavaScript.
- Establish reliable regression, smoke, integration, and end-to-end testing suites.
- Identify gaps in test coverage and develop strategies to improve testing quality.
- Integrate automated tests into CI/CD pipelines.
- Investigate test failures, identify root causes, and collaborate with developers on fixes.
- Improve automation stability, execution speed, and maintainability.
- Maintain clear test cases, documentation, and defect reports.

Web3 & *Blockchain* Testing

- Test *wallet*-connected applications and *blockchain* transaction workflows.
- Validate *wallet* connections, disconnections, network switching, and transaction signing.
- Test interactions between frontend applications, backend services, and *smart contract*s.
- Verify *blockchain* transaction submission, confirmation tracking, and failure handling.
- Develop automated tests for deposits, withdrawals, *token* transfers, and digital asset transactions.
- Test *smart contract* integrations using Hardhat, Foundry, Tenderly, or similar tools.
- Create local *blockchain* environments, mocks, or test networks for reliable automated testing.
- Validate application behavior across supported *EVM*-compatible *blockchain* networks.
- Test transaction failures, insufficient balances, gas estimation errors, rejected signatures, and network interruptions.
- Collaborate with *blockchain* engineers to identify integration issues and unexpected on-chain behavior.

- Verify that *blockchain* events and transaction data are correctly reflected in backend services and user interfaces.

Fintech & Payments Testing

- Develop testing scenarios for payment initiation, transaction processing, refunds, and settlement.
- Validate financial transaction workflows across frontend, backend, and *blockchain* components.
- Test payment status updates, transaction histories, and financial reporting interfaces.
- Verify data consistency between application databases and *blockchain* transaction records.
- Test authentication, authorization, and identity verification integrations.
- Develop scenarios covering duplicate transactions, failed payments, retries, and interrupted workflows.
- Ensure important financial operations behave correctly under expected and unexpected conditions.
- Collaborate with backend engineers to validate APIs, transaction states, and error handling.

API & Integration Testing

- Design and maintain automated API tests for REST and GraphQL services.
- Use Postman, Swagger, and programmatic testing tools to validate API behavior.
- Test authentication flows, request validation, response structures, and error handling.
- Validate communication between microservices and external service providers.
- Develop mocks and test data for complex integration scenarios.
- Test asynchronous workflows, event processing, and transaction status updates.
- Verify integrations with *wallet* providers, *blockchain* RPC services, payment gateways, and third-party APIs.

CI/CD & Release Quality

- Integrate automated tests with GitHub Actions, GitLab CI, Jenkins, or similar systems.
- Establish automated quality checks for development, staging, and production release workflows.
- Improve test reporting, execution reliability, and visibility into test results.
- Work with DevOps engineers to maintain stable testing environments.
- Support release readiness reviews and identify critical defects before deployment.
- Monitor recurring failures and improve testing processes to prevent regressions.
- Help establish consistent QA standards across different engineering teams.

Collaboration & Technical Ownership

- Work closely with developers, product managers, and designers to understand requirements and expected behavior.
- Participate in technical discussions and identify testing risks early in development.
- Review feature requirements and propose appropriate testing scenarios.
- Provide clear feedback on product quality, defects, and release risks.
- Mentor junior QA engineers and support improvements in automation practices.
- Contribute to code reviews involving automation frameworks and testing utilities.
- Take ownership of complex testing challenges and maintain high engineering standards.

Required Skills & Experience

- 5+ years of professional software quality assurance or test automation engineering experience.
- 2+ years of practical experience testing *Web3* applications, *blockchain* integrations, or *cryptocurrency*-related products.
- S*tron*g hands-on experience developing automated tests using **TypeScript or JavaScript**.
- Professional experience with **Playwright, Cypress, Puppeteer, WebdriverIO**, or similar automation frameworks.
- S*tron*g understanding of software testing principles, testing m*eth*odologies, and QA processes.
- Experience designing and maintaining automation frameworks for production applications.
- S*tron*g knowledge of end-to-end testing, integration testing, regression testing, and smoke testing.
- Practical understanding of *Ethereum*, *EVM*-compatible *blockchain* networks, and *Web3* application behavior.
- Experience testing *wallet* integrations, *smart contract* interactions, or *blockchain* transaction workflows.
- Familiarity with *MetaMask*, *Wallet*Connect, or similar *wallet* technologies.
- Understanding of transaction signing, gas fees, transaction confirmations, and common *blockchain* errors.
- Experience testing REST APIs using Postman or programmatic automation tools.
- Familiarity with browser developer tools and proxy debugging tools such as Charles or equivalent software.
- Experience with Git, CI/CD pipelines, and automated release processes.
- Ability to investigate complex defects and communicate findings clearly.
- Experience writing test plans, test cases, bug reports, and testing documentation.
- S*tron*g analytical skills and attention to detail.
- Professional English communication skills and experience collaborating with remote engineering teams.

Nice to Have (Differentiators)

- Previous experience testing *DeFi* protocols, decentralized exchanges, staking platforms, or *blockchain wallet*s.
- Experience with Hardhat, Foundry, Tenderly, or local *EVM* test environments.
- Familiarity with *Solidity* and *smart contract* testing principles.
- Knowledge of *Eth*ers.js, Viem, *Web3*.js, or other *blockchain* integration libraries.
- Experience validating *smart contract* events and on-chain data.
- Familiarity with Arbitrum, Optimism, Base, Polygon, or other *EVM*-compatible networks.
- Experience testing cross-chain transactions, *blockchain* bridges, or *token swap*s.
- Knowledge of *blockchain* in*dex*ing, RPC services, and transaction monitoring.
- Experience with financial applications, payment processing, digital assets, or banking systems.
- Familiarity with SQL, PostgreSQL, Redis, or database validation.
- Experience testing event-driven systems, microservices, and asynchronous workflows.
- Knowledge of WebSocket testing and real-time application behavior.
- Experience with Docker and containerized testing environments.
- Familiarity with performance testing tools such as k6, JMeter, or Locust.
- Experience with mobile application testing using Appium or similar tools.
- Familiarity with security testing fundamentals, authentication, and access control validation.
- Experience implementing QA processes for early-stage products or distributed engineering teams.
- Experience mentoring QA engineers or reviewing automation code.

Senior-Level Expectations

As a Senior *Web3* QA Automation Engineer, you will be expected to:

- Independently design and maintain automated testing frameworks.
- Take ownership of testing quality for assigned products and features.
- Identify risks early and recommend practical testing strategies.
- Write reliable, maintainable automation code.
- Understand complex *blockchain* transaction workflows and their testing requirements.
- Collaborate with developers to investigate and resolve difficult defects.
- Improve testing coverage and reduce recurring production issues.
- Establish reusable testing practices that can support multiple products.
- Support release planning and provide informed assessments of product quality.
- Mentor less experienced QA engineers when appropriate.
- Remain actively involved in hands-on testing, automation development, and technical problem-solving.

This is a senior individual contributor position. Formal team management is not required, although technical ownership and mentorship are expected.

Example Problems You'll Work On

1. *Wallet* Connection and Authentication

Build automated tests that verify *wallet* connections, network switching, account changes, rejected signatures, session expiration, and disconnection handling.

Ensure applications behave correctly when *wallet* providers are unavailable or users interrupt a transaction.

2. *Blockchain* Payment Testing

Test workflows involving digital asset payments, deposits, withdrawals, transaction fees, and settlement.

Verify that application interfaces accurately reflect pending, successful, failed, and interrupted transactions.

3. *Smart Contract* Integration Testing

Develop automated tests that validate interactions between application services and deployed *smart contract*s.

Use controlled test environments to reproduce transaction failures, contract errors, and unexpected *blockchain* responses.

4. Financial Transaction Reliability

Test scenarios involving duplicate requests, delayed confirmations, failed transactions, retry mechanisms, and inconsistent transaction states.

Work with backend engineers to ensure financial records remain accurate across system failures.

5. *DeFi* Application Testing

Build automated tests for *wallet*-connected interfaces supporting *token swap*s, staking, rewards, and other decentralized financial operations.

Verify balances, transaction parameters, user permissions, and application behavior.

6. API and Backend Validation

Create automated tests for transaction-processing APIs, *wallet* services, authentication, and financial reporting endpoints.

Validate both successful workflows and negative scenarios involving invalid requests or unavailable dependencies.

7. Cross-Chain Transaction Testing

Test application workflows involving multiple *blockchain* networks, including network switching, transaction status updates, and external bridge integrations.

Verify that users receive clear information when cross-chain operations are delayed or fail.

8. Automated Release Testing

Develop automated regression suites that execute in CI/CD pipelines before important releases.

Improve testing reliability and reduce the likelihood of critical payment or *blockchain* integration failures reaching production.

Why This Role Matters

As we establish our planned software development operations in Poland, quality engineering will be essential to delivering reliable fintech and *Web3* applications.

Our products will involve financial transactions, *blockchain* integrations, *wallet*s, and external payment services. Errors in these areas can directly affect transaction accuracy, user *trust*, and platform reliability.

The Senior *Web3* QA Automation Engineer will help establish s*tron*g testing practices from the beginning and ensure that our applications behave correctly across complex financial and *blockchain* workflows.

This position offers ownership of testing frameworks, automation architecture, and product quality across different applications.

You will work closely with engineering teams, contribute directly to automation code, and help improve release confidence as our products grow.

We are looking for an engineer who combines **s*tron*g TypeScript automation skills, practical *Web3* testing experience, API testing expertise, and a structured approach to software quality**.

Our goal is to build financial applications that are secure, reliable, and thoroughly tested before reaching users.
