Staff *Blockchain* Security Engineer — *Web3* Fintech & Payments

Location: Remote / Poland (International Team)
Employment Type: Full-time / Contract
Reports To: Head of *Blockchain* Engineering / Chief Technology Officer

About the Company

Plaid is a financial technology company that provides infrastructure connecting financial applications with banks and financial institutions. Its technology supports secure financial data access, account verification, identity verification, and payment services.

We are planning to establish a new software development company in Poland, focusing on fintech, payments infrastructure, and *blockchain*-based financial products.

Our planned projects cover real estate marketplaces, gaming, sports betting, and *Web3* social finance platforms. We aim to combine traditional financial technologies with *blockchain* infrastructure to support digital payments, *wallet* integrations, transaction processing, *smart contract*s, and decentralized financial services.

We are building an international engineering team and looking for experienced engineers who can help establish secure infrastructure, solve complex technical problems, and contribute to product development from an early stage.

About the Role

We are looking for an experienced **Staff *Blockchain* Security Engineer** to design, implement, and improve the security of our *blockchain* infrastructure and *Web3* financial applications.

This is a senior, hands-on technical position focused on *blockchain* security architecture, *smart contract* security, transaction protection, and infrastructure security.

You will work closely with *blockchain* engineers, backend developers, DevOps engineers, and product teams to identify security risks, design practical protections, and ensure that our financial systems are secure and reliable.

We are looking for someone who can take ownership of complex security challenges, write production code, review critical components, and guide engineers on secure *blockchain* development practices.

This is not a purely auditing or advisory position. We expect meaningful hands-on engineering involvement.

What You'll Do

- Design and implement security architecture for *blockchain* infrastructure, *smart contract*s, and *Web3* financial applications.
- Conduct security reviews of *Solidity smart contract*s, *blockchain* integrations, and transaction-processing services.
- Identify vulnerabilities in *smart contract*s, *wallet* integrations, transaction flows, and *blockchain*-connected backend systems.
- Develop security tools, monitoring services, and automated detection mechanisms for *blockchain* applications.
- Perform threat modeling and security assessments for payment, escrow, settlement, withdrawal, and digital asset transfer systems.
- Implement transaction monitoring and security controls to detect suspicious activity and potential exploits.
- Review *smart contract* access control, upgradeability, authorization, external calls, and financial accounting logic.
- Build and maintain automated security testing frameworks using fuzz testing, invariant testing, and integration testing.
- Collaborate with engineering teams to fix vulnerabilities and improve security before production deployment.
- Evaluate security risks related to *blockchain* bridges, cross-chain transactions, oracles, and external *DeFi* integrations.
- Improve security practices for *blockchain* nodes, RPC services, in*dex*ing pipelines, and backend infrastructure.
- *Defi*ne secure development standards, code review practices, and deployment procedures.
- Support incident investigation, vulnerability remediation, and security improvements when required.
- Work with external auditors and security researchers to coordinate reviews and resolve findings.
- Mentor engineers on secure coding practices and contribute to important architectural decisions.
- Remain hands-on with coding, testing, debugging, and implementing critical security components.

Required Skills & Experience

- 7+ years of professional software engineering or security engineering experience.
- 3+ years of substantial hands-on *blockchain* security, *smart contract* security, or *Web3* infrastructure security experience.

- Proven experience securing production *blockchain* applications, *smart contract*s, or digital asset infrastructure.
- S*tron*g knowledge of *Ethereum*, *EVM*-compatible networks, and *blockchain* transaction lifecycles.
- S*tron*g understanding of *Solidity*, *EVM* execution, *smart contract* architecture, and common attack vectors.
- Experience identifying and mitigating vulnerabilities such as reentrancy, access control failures, oracle manipulation, signature replay, and economic exploits.
- Hands-on experience with Foundry, Hardhat, Slither, or similar *smart contract* development and security tools.
- Experience with fuzz testing, invariant testing, static analysis, and automated security testing.
- S*tron*g programming skills in *Solidity* and at least one general-purpose language such as Go, *Rust*, TypeScript, or Python.
- Understanding of *crypto*graphic signatures, hashing, key management, authentication, and secure transaction authorization.
- Experience reviewing APIs, backend services, or distributed infrastructure used in *blockchain* applications.
- Familiarity with Linux, Docker, cloud infrastructure, CI/CD pipelines, and production monitoring.
- Ability to independently investigate complex vulnerabilities and implement practical security improvements.
- Experience conducting security reviews, reviewing code, and communicating security risks to engineering teams.
- S*tron*g analytical, problem-solving, and communication skills.
- Professional English communication skills.

Nice to Have (Differentiators)

- Previous experience in fintech, payment infrastructure, *DeFi*, digital asset custody, or *cryptocurrency* exchanges.
- Experience securing *blockchain* bridges, rollups, cross-chain messaging systems, or interoperability protocols.
- Knowledge of Layer 2 networks, account abstraction, transaction validation, and *EVM* execution clients.
- Experience with Forta, OpenZeppelin Defender, Tenderly, or *blockchain* threat detection infrastructure.
- Experience participating in *smart contract* audit competitions such as Code4rena, Sherlock, or Cantina.
- Published *smart contract* security audits, vulnerability research, or responsible disclosures.
- Familiarity with formal verification, symbolic execution, and advanced program analysis.
- Experience with *DeFi* economic security, liquidation mechanisms, liquidity pools, lending protocols, or settlement systems.

- Knowledge of MPC *wallet*s, multisignature systems, HSMs, custody infrastructure, or secure signing services.
- Experience with runtime transaction screening, anomaly detection, or fraud prevention systems.
- Understanding of zero-knowledge *crypto*graphy, *trust*ed execution environments, or secure multiparty computation.
- Experience with Go or *Rust*-based *blockchain* infrastructure.
- Familiarity with Kubernetes, Terraform, Prom*eth*eus, Grafana, and OpenTelemetry.
- Previous experience establishing security engineering standards for early-stage *blockchain* or fintech products.

Staff-Level Expectations

As Staff *Blockchain* Security Engineer, you will be expected to:

- Own major *blockchain* security architecture decisions across critical systems.
- Identify security risks early and influence system design before development begins.
- Remain actively involved in engineering, including coding, security tooling, vulnerability remediation, and critical component development.
- *Defi*ne security standards that can be applied consistently across multiple products and engineering teams.
- Lead technical security reviews and guide engineers through complex *blockchain* security challenges.
- Evaluate trade-offs between security, performance, development speed, and operational requirements.
- Collaborate with *blockchain* architects and engineering leads on important infrastructure decisions.
- Mentor engineers and improve the team's overall security knowledge.
- Support incident response and establish effective vulnerability prevention and remediation processes.
- Work with external security auditors and ensure findings are properly resolved.
- Help establish long-term *blockchain* security practices as our engineering organization grows.

This is an individual contributor role with significant technical influence. It does not require direct people management, but it does require s*trong* ownership, technical judgment, and the ability to guide engineers across different teams.

Example Problems You'll Work On

Smart Contract Security

Review and strengthen contracts handling escrow, payments, settlement, refunds, fees, rewards, and digital asset transfers.

Identify vulnerabilities involving authorization, reentrancy, upgradeability, incorrect accounting, and unexpected contract interactions.

Blockchain Transaction Security

Design protections for deposit and withdrawal processing, transaction signing, confirmation tracking, replay prevention, and financial reconciliation.

Ensure transaction systems behave safely during network failures, chain reorganizations, and unexpected *blockchain* conditions.

Cross-Chain Security

Evaluate risks associated with *token* bridges, cross-chain messages, liquidity routing, and external *blockchain* integrations.

Develop monitoring and validation mechanisms to reduce the risk of unauthorized or incorrect financial transactions.

Wallet and Key Management

Work with infrastructure engineers to establish secure transaction signing, *wallet* access controls, key management integrations, and approval workflows.

Runtime Security Monitoring

Build tools and services that monitor *blockchain* activity, identify abnormal transaction patterns, and detect potential attacks against financial applications.

Security Testing and Automation

Develop reusable fuzz tests, invariant tests, security checks, and automated analysis pipelines that help engineers discover vulnerabilities before deployment.

Secure *Blockchain* Infrastructure

Review RPC integrations, *blockchain* nodes, in*dex*ing services, and backend transaction systems to improve infrastructure security and operational reliability.

Why This Role Matters

Security will be a critical foundation for our planned fintech and *Web3* products, particularly for systems involving payments, digital assets, *wallet*s, and *blockchain*-based financial transactions.

The Staff *Blockchain* Security Engineer will help ensure that security is considered from the beginning of system design through development, testing, deployment, and production operations.

This role offers the opportunity to influence security architecture across multiple products, solve challenging *blockchain* security problems, and help establish s*tron*g engineering practices as we build our international team in Poland.

We are looking for someone who combines deep *blockchain* security expertise with practical software engineering skills and enjoys building secure systems rather than only identifying vulnerabilities.
