Staff *Smart Contract* Engineer — *Web3* Fintech & Payments

Location: Remote / Poland (International Team)
Employment Type: Full-time / Contract
Reports To: Head of *Blockchain* Engineering / Chief Technology Officer

About the Company

Plaid is a financial technology company that provides infrastructure connecting financial applications with banks and financial institutions. Its technology supports secure financial data access, account verification, identity verification, and payment services.

Separately, we are planning to establish a new software development company in Poland, focusing on fintech, payment infrastructure, and *blockchain*-based financial products.

Our planned projects cover real estate marketplaces, gaming, sports betting, and *Web3* social finance platforms. We aim to combine traditional financial technologies with *blockchain* infrastructure to support digital payments, *wallet* integrations, transaction processing, *smart contract*s, and decentralized financial services.

We are building an international engineering team and looking for experienced engineers who can help shape our products and technical architecture from an early stage.

About the Role

We are looking for an experienced **Staff *Smart Contract* Engineer** to lead the technical design, development, and maintenance of *smart contract*s supporting our *Web3* fintech and payments applications.

This is a senior individual contributor role that combines hands-on *Solidity* development, *smart contract* architecture, security-conscious engineering, and technical mentorship.

You will work closely with *blockchain* engineers, backend developers, security engineers, and product teams to design reliable on-chain financial systems and integrate them with off-chain applications.

Your responsibilities will include developing *smart contract*s for payments, escrow, settlement, refunds, digital asset transfers, and other *blockchain*-based financial operations.

We are looking for someone who can independently own complex engineering problems, make important architectural decisions, and contribute directly to production code.

This is not a purely advisory or management role. Hands-on *smart contract* development is a central part of the position.

What You'll Do

- Design, develop, test, and deploy secure *smart contract*s using *Solidity* and *EVM*-compatible networks.
- Own the architecture of important *smart contract* components across multiple *Web3* and fintech products.
- Develop *smart contract*s supporting payment processing, escrow, settlement, payouts, refunds, fees, and digital asset transfers.
- Design staking, rewards, *token* distribution, and asset management mechanisms where required by the product.
- Implement reliable *smart contract* integrations with backend transaction-processing services and *wallet* infrastructure.
- Design contract architectures that support maintainability, appropriate upgradeability, and operational security.
- Optimize gas usage and improve *smart contract* execution efficiency.
- Review *smart contract*s for vulnerabilities, financial logic errors, access control problems, and unexpected transaction behavior.
- Develop comprehensive automated tests using Foundry, Hardhat, or similar frameworks.
- Implement fuzz testing, invariant testing, and integration testing for critical contract functionality.
- Collaborate with security engineers and external auditors to identify and resolve vulnerabilities.
- *Defi*ne *smart contract* development standards, code review practices, and deployment procedures.
- Work with backend engineers to design interactions between on-chain contracts and off-chain payment systems.
- Evaluate *EVM*-compatible networks and Layer 2 solutions based on security, execution costs, reliability, and product needs.
- Investigate production issues, transaction failures, contract interactions, and *blockchain*-related bugs.
- Mentor other engineers and guide important technical decisions.
- Participate in architecture reviews, technical planning, and cross-team engineering discussions.
- Remain actively involved in coding, debugging, testing, and delivering production-ready *smart contract*s.

Required Skills & Experience

- 8+ years of professional software engineering experience, including substantial experience developing production *blockchain* applications.
- 4+ years of hands-on *Solidity* and *EVM smart contract* development experience.
- Proven experience designing, deploying, and maintaining *smart contract*s used in production.
- S*tron*g understanding of *Ethereum*, *EVM* execution, transaction lifecycles, gas mechanics, and *smart contract* architecture.
- Experience implementing financial *smart contract*s involving *token* transfers, payments, staking, escrow, settlement, or similar operations.
- Advanced *Solidity* programming skills and experience with common contract patterns.
- S*tron*g knowledge of ERC-20, ERC-721, ERC-1155, and relevant *token* standards.
- Experience with OpenZeppelin Contracts and secure *smart contract* design practices.
- Hands-on experience with Foundry, Hardhat, or equivalent development and testing frameworks.
- S*tron*g understanding of common *smart contract* vulnerabilities, including reentrancy, access control failures, signature replay, oracle manipulation, and incorrect financial accounting.
- Experience conducting detailed code reviews and implementing security improvements.
- S*tron*g experience with automated testing, fuzz testing, and invariant testing.
- Familiarity with *blockchain* integrations using *eth*ers.js, viem, *web3*.js, or similar libraries.
- Proficiency in TypeScript or JavaScript for *blockchain* application development and integration.
- Experience integrating *smart contract*s with backend services, APIs, *wallet*s, and transaction-processing systems.
- Understanding of distributed systems, *blockchain* confirmations, transaction finality, and chain reorganizations.
- Familiarity with Git, CI/CD, cloud infrastructure, and production deployment workflows.
- Ability to independently own complex technical components and influence engineering decisions.
- S*tron*g communication and collaboration skills in an international development environment.

Nice to Have (Differentiators)

- Previous experience in fintech, payment infrastructure, digital asset platforms, or *DeFi*.
- Experience developing *smart contract*s for escrow, lending, *trading*, staking, rewards, or settlement systems.
- Experience with Arbitrum, Optimism, Base, Polygon, zkSync, or other *EVM*-compatible networks.
- Knowledge of account abstraction, EIP-4337, and modern *wallet* infrastructure.
- Experience with Layer 2 networks, rollups, and cross-chain messaging protocols.

- Familiarity with *blockchain* bridges, interoperability protocols, and liquidity routing.
- Experience with *Solidity* upgradeable contract patterns and OpenZeppelin upgrade frameworks.
- Understanding of digital asset custody, MPC *wallet*s, multisignature approvals, and secure transaction signing.
- Experience building *blockchain*-connected gaming applications or *NFT* infrastructure.
- Familiarity with on-chain financial accounting, vault architectures, and *DeFi* protocol mechanics.
- Knowledge of formal verification, symbolic execution, Slither, Echidna, or other advanced security testing tools.
- Experience participating in *smart contract* audits, security reviews, or responsible vulnerability disclosures.
- Experience with transaction monitoring, *blockchain* in*dex*ing, and event-driven backend systems.
- Proficiency in Go, *Rust*, or Python for *blockchain*-related backend development.
- Experience integrating KYC, compliance, identity verification, or conventional payment services with *blockchain* applications.
- Experience contributing to open-source *blockchain* libraries or developer tooling.
- Previous experience mentoring engineers or establishing *smart contract* engineering practices.

Staff-Level Expectations

As a Staff *Smart Contract* Engineer, you will be expected to:

- Take ownership of critical *smart contract* architecture and implementation across multiple products.
- Make technical decisions that affect security, reliability, scalability, and long-term maintainability.
- Remain hands-on with *Solidity* development and critical code contributions.
- Establish coding standards, testing practices, and security requirements for *smart contract* engineering.
- Lead technical design reviews and guide other engineers through complex *blockchain* challenges.
- Collaborate with backend and infrastructure teams to design reliable on-chain and off-chain interactions.
- Identify vulnerabilities and architectural risks before they affect production systems.
- Support security audits and ensure critical findings are properly addressed.
- Mentor engineers and improve the team's *smart contract* development capabilities.
- Balance delivery speed, technical quality, security, and transaction costs.
- Contribute to long-term technical planning and evaluate new *blockchain* technologies when appropriate.

This position is a senior individual contributor role with broad technical ownership. Formal people management is not required, but s*trong* technical leadership and mentorship are expected.

Example Problems You'll Work On

1. Payment and Settlement *Smart Contract*s

Design *smart contract*s that securely receive, hold, distribute, and settle digital asset payments.

Implement payment authorization, fee distribution, refund mechanisms, and settlement verification while maintaining accurate on-chain accounting.

2. Escrow and Conditional Payments

Develop *smart contract*s that manage escrow balances and release funds according to clearly *defi*ned conditions.

Support financial workflows where payments depend on approvals, transaction status, or verified application events.

3. *Wallet* and Backend Integrations

Work with backend engineers to connect *smart contract*s with *wallet* infrastructure, transaction submission services, and financial databases.

Ensure that contract events, transaction confirmations, failed transactions, and chain reorganizations are handled reliably.

4. Secure Contract Architecture

Design access control, authorization, emergency controls, and upgrade mechanisms appropriate for financial *smart contract*s.

Review contract logic to reduce the risk of unauthorized transfers, financial accounting errors, and unexpected execution behavior.

5. Gas and Transaction Optimization

Improve *smart contract* performance and reduce execution costs without compromising security.

Evaluate different contract patterns and *blockchain* networks based on expected transaction volume and product requirements.

6. Automated Security Testing

Build comprehensive test suites covering normal execution, unusual transaction sequences, boundary conditions, and attempted misuse.

Use fuzz testing and invariant testing to verify that important financial properties remain correct.

7. Gaming and *Web3* Financial Operations

Develop *smart contract* components supporting digital asset transactions, rewards, payouts, and *blockchain*-connected gaming experiences.

For sports betting applications, this may include settlement, refunds, and payout logic that depends on verified off-chain results.

8. Cross-Chain Financial Integrations

Evaluate and implement secure interactions with supported cross-chain messaging systems, bridges, or settlement infrastructure where required.

Consider differences in finality, message verification, failure recovery, and operational security across networks.

Why This Role Matters

*Smart contract*s will be an important part of our planned *Web3* fintech and payments applications, especially where funds, digital assets, and financial transactions are handled on-chain.

The Staff *Smart Contract* Engineer will help establish a secure and maintainable foundation for these systems.

This position offers significant ownership of *smart contract* architecture, production engineering, technical standards, and security practices from an early stage.

You will have the opportunity to solve challenging financial engineering problems, contribute directly to critical *blockchain* functionality, and help guide the development of multiple *Web3* products.

We are looking for an engineer who combines **deep *Solidity* expertise, practical security awareness, s*trong*g software engineering fundamentals, and hands-on technical leadership**.

Our goal is to build reliable financial applications where smart contracts are secure, efficient, understandable, and designed for real-world production use.
