Blockchain Smart Contract Engineer

Location: Remote / Poland (International Team)
Employment Type: Full-time / Part-time / Contract
Department: *Blockchain* Engineering
Reports To: Head of Engineering / *Blockchain* Lead
Seniority: Mid-Level to Senior

About the Company

We are preparing to establish an independent software development company in Poland, focused on building modern financial technology, payment infrastructure, and *blockchain*-powered applications.

Our planned products and technical initiatives include:

- ***Blockchain* & *Web3* Infrastructure:** *Smart contract* systems, *blockchain* integrations, decentralized applications, and digital asset management.
- ***DeFi* & Decentralized Exchanges:** *Token swap*s, staking, liquidity management, and decentralized financial services.
- **Fintech & Payment Solutions:** Digital payment processing, stable*coin* transactions, *cryptocurrency* transfers, and financial settlement systems.
- ***Web3 Wallet* Applications:** *Wallet* connectivity, transaction management, digital asset transfers, and *blockchain* account integrations.
- **Real Estate & *Token*ization Platforms:** Real estate investment applications, asset *token*ization, and *blockchain*-based ownership verification.

Our goal is to combine reliable software engineering with practical *blockchain* technology to develop secure, scalable, and user-friendly financial products.

We are building an international engineering team and looking for talented engineers who can contribute to our technical foundation and help deliver high-quality *blockchain* applications.

About the Role

We are looking for a ***Blockchain Smart Contract* Engineer** to design, develop, test, and maintain secure *smart contract*s and *blockchain* integrations for our *Web3* and financial technology applications.

This is a hands-on engineering position primarily focused on ***Solidity*, *Ethereum* Virtual Machine (*EVM*) development, *smart contract* security, and *blockchain* application integration**.

You will collaborate with backend engineers, frontend developers, *blockchain* architects, and product teams to implement *blockchain*-based functionality supporting digital assets, decentralized finance, *wallet*s, and payment workflows.

The ideal candidate understands *smart contract* development beyond writing *Solidity* code. You should be comfortable working with *blockchain* transactions, *token* standards, contract deployment, automated testing, and integration with off-chain services.

We value engineers who prioritize security, reliability, maintainability, and practical problem-solving.

What You'll Do

Smart Contract Development

- Design, implement, and maintain *smart contract*s using *Solidity*.
- Develop *smart contract* components for digital asset management, payments, staking, and decentralized applications.
- Implement *token*-related functionality using established *Ethereum* standards.
- Develop secure contract interfaces for interaction with frontend and backend services.
- Design modular and reusable *smart contract* architectures.
- Implement role-based access controls and transaction authorization mechanisms.
- Optimize *smart contract*s for execution efficiency, gas usage, and maintainability.
- Participate in *smart contract* architecture discussions and code reviews.

Blockchain & *Web3* Integration

- Integrate *smart contract*s with *Ethereum* and *EVM*-compatible *blockchain* networks.
- Develop *blockchain* transaction workflows, including preparation, signing, submission, and confirmation tracking.
- Work with RPC providers, *blockchain* nodes, and in*dex*ing services.
- Support *wallet* connectivity and interactions between decentralized applications and *blockchain* networks.
- Collaborate with backend teams to process *smart contract* events and synchronize on-chain data.
- Implement integrations with *token*s, decentralized protocols, and digital asset services.
- Help manage *blockchain* network differences, transaction fees, and confirmation requirements.
- Support integration of on-chain and off-chain application components.

DeFi & Digital Asset Functionality

- Contribute to *smart contract*s supporting decentralized exchanges, staking systems, and *token* operations.
- Integrate existing *DeFi* protocols and *smart contract* interfaces.
- Implement secure *token* transfers, deposits, withdrawals, and rewards distribution.
- Support stable*coin* transactions and *blockchain* payment settlement.
- Develop financial contract logic involving balances, fees, and asset accounting.
- Collaborate on integrations involving liquidity pools, vaults, and decentralized *trading* applications.
- Evaluate *smart contract* dependencies and identify potential protocol risks.
- Work with product and engineering teams to translate financial requirements into reliable *blockchain* functionality.

Smart Contract Security

- Follow secure *Solidity* development practices and established security standards.
- Identify and prevent common *smart contract* vulnerabilities, including reentrancy, access-control errors, arithmetic issues, and unsafe external calls.
- Implement appropriate authorization, pausing, and emergency control mechanisms.
- Review contracts for potential logic vulnerabilities and financial accounting inconsistencies.
- Apply secure patterns for interacting with external *token*s and protocols.
- Participate in internal security reviews and external audits.
- Resolve audit findings and improve contract security.
- Document contract assumptions, *trust* boundaries, and important security considerations.

Testing & Deployment

- Write unit and integration tests using Foundry, Hardhat, or similar development frameworks.
- Develop automated tests for normal workflows, edge cases, and failure conditions.
- Apply fuzz testing and invariant testing where appropriate.
- Use tools such as Slither and other static analyzers to identify potential security issues.
- Develop and maintain deployment scripts for testnets and production networks.
- Verify deployed contracts and maintain deployment documentation.
- Integrate *smart contract* testing with CI/CD pipelines.
- Investigate contract failures and unexpected on-chain behavior.
- Support safe deployment and upgrade procedures.

Collaboration & Engineering Practices

- Work closely with backend, frontend, DevOps, and security engineers.
- Participate in technical design discussions and implementation planning.
- Review code and provide constructive feedback to other engineers.
- Write clear documentation for contract interfaces, deployments, and system behavior.
- Help *defi*ne *blockchain* engineering standards and reusable development practices.
- Communicate technical risks and implementation trade-offs to the broader team.
- Stay informed about developments in *Ethereum*, *EVM*-compatible networks, and *blockchain* security.

Required Skills & Experience

- 3+ years of professional software development experience, including meaningful hands-on *smart contract* engineering.
- S*tron*g proficiency in *Solidity*.
- Practical understanding of *Ethereum*, *EVM* execution, gas mechanics, and *blockchain* transactions.
- Experience developing, testing, and deploying *smart contract*s on *EVM*-compatible networks.
- Familiarity with *smart contract* development frameworks such as Foundry or Hardhat.
- Understanding of *Ethereum token* standards, particularly ERC-20 and ERC-721.
- Knowledge of *smart contract* security vulnerabilities and secure coding practices.
- Experience with automated testing, debugging, and contract deployment workflows.
- Ability to integrate *smart contract*s with *Web3* applications and backend services.
- Familiarity with *eth*ers.js, viem, *web3*.js, or equivalent *blockchain* libraries.
- Understanding of *wallet* connections, signing operations, transaction confirmation, and contract events.
- Experience using Git, pull requests, code reviews, and CI/CD pipelines.
- S*tron*g problem-solving skills and attention to correctness.
- Ability to work independently and collaborate effectively with remote engineering teams.

Nice to Have (Differentiators)

- Experience building production *DeFi* applications or *smart contract*s.
- Familiarity with *Uniswap*, *Aave*, Curve, Compound, or similar protocols.
- Experience implementing staking, vault, lending, or liquidity management systems.
- Knowledge of ERC-4626, ERC-1155, EIP-712, and EIP-2612.
- Experience with proxy contracts and upgradeability patterns.
- Familiarity with OpenZeppelin libraries and security practices.
- Experience with Foundry fuzz testing, invariant testing, or formal verification tools.
- Understanding of oracle design, flash-loan attacks, MEV, and *DeFi* economic risks.
- Experience integrating stable*coin* payments or settlement workflows.

- Familiarity with Layer 2 networks such as Arbitrum, Optimism, Base, or Polygon.
- Knowledge of cross-chain messaging and *blockchain* interoperability.
- Experience with account abstraction and ERC-4337.
- Familiarity with *Rust*, Go, Node.js, TypeScript, or Python for backend *blockchain* services.
- Experience building *blockchain* event in*dex*ers or transaction-monitoring services.
- Previous participation in security audits, bug bounty programs, or *smart contract* security reviews.
- Open-source contributions to *blockchain* projects, *Solidity* libraries, or developer tooling.

Education

- Bachelor's degree in Computer Science, Software Engineering, Information Technology, Mathematics, or a related technical field.
- Equivalent professional experience and demonstrated *smart contract* engineering ability are equally valued.
- Relevant *blockchain* projects, open-source contributions, or production *smart contract* deployments are highly appreciated.

What Success Looks Like

First 3 Months

- Understand the company's planned *blockchain* products and technical architecture.
- Become familiar with the *smart contract* development environment and engineering standards.
- Contribute to *Solidity smart contract* development and testing.
- Integrate contracts with existing or planned backend and frontend components.
- Identify potential security concerns and technical improvements.
- Participate actively in code reviews and technical discussions.

Within 6 Months

- Independently develop and deliver production-ready *smart contract* components.
- Implement *blockchain* functionality supporting digital assets, payments, or *DeFi* applications.
- Build reliable automated tests and deployment workflows.
- Improve *smart contract* security, efficiency, and maintainability.
- Collaborate effectively with other engineers to deliver integrated *blockchain* features.
- Maintain clear technical documentation and support safe releases.

Long-Term

- Contribute to secure and scalable *blockchain* infrastructure.
- Support the expansion of *wallet*, payment, and *DeFi* functionality.
- Improve *smart contract* development and security practices.
- Help establish reusable *blockchain* components across multiple products.
- Take increasing ownership of *blockchain* features and technical decisions.

Why Join Us?

- Work on *blockchain* and financial technology products from an early development stage.
- Build *smart contract*s with practical applications in payments, digital assets, decentralized finance, and *token*ization.
- Collaborate with an international engineering team.
- Participate in architecture decisions and contribute ideas to product development.
- Gain exposure to different *blockchain* ecosystems and financial applications.
- Work in a remote-friendly environment with flexible collaboration options.
- Explore full-time, part-time, or contract arrangements.
- Contribute to building secure and maintainable *blockchain* systems with long-term technical potential.

Ideal Candidate

We are looking for a practical, security-conscious *blockchain* engineer who enjoys designing and building *smart contract* applications.

You should have s*trong Solidity* fundamentals and understand how *blockchain* contracts interact with *wallet*s, backend services, and decentralized protocols.

You should be comfortable developing features independently, writing comprehensive tests, and investigating unexpected *smart contract* behavior.

Experience with production *DeFi* protocols, *token* management, or *cryptocurrency* payment systems would be particularly valuable.

We value engineers who can balance rapid product development with the security and reliability requirements of software handling financial assets.

The ideal Blockchain Smart Contract Engineer combines hands-on Solidity development, strong EVM knowledge, security awareness, and the ability to deliver reliable smart contract functionality for real-world financial applications.
