Senior Full-Stack Engineer — Fintech & Payment Applications

Location: Remote / Poland (International Team)
Employment Type: Full-time / Part-time / Contract
Department: Software Engineering
Reports To: Head of Engineering / Engineering Manager
Seniority: Senior

About the Company

We are preparing to establish an independent software development company in Poland, focused on developing modern financial technology, payment infrastructure, and digital financial applications.

Our planned projects include fintech platforms, payment processing solutions, digital asset services, real estate investment marketplaces, and *blockchain*-integrated financial applications.

Our goal is to build secure, scalable, and user-friendly software products that simplify financial transactions and connect traditional financial services with modern technologies.

We are assembling an international engineering team and looking for experienced developers who enjoy solving practical technical challenges and building reliable products.

About the Role

We are looking for a **Senior Full-Stack Engineer** to help design, develop, and maintain our fintech and payment applications.

This is a hands-on engineering role combining frontend development, backend architecture, API integrations, and financial transaction workflows.

You will work closely with product managers, designers, and other engineers to deliver secure and scalable applications, from initial architecture and implementation through testing, deployment, and ongoing improvement.

The ideal candidate has s*trong* experience building production web applications, understands modern distributed systems, and is comfortable working with financial data, payment integrations, and security-sensitive workflows.

Previous experience in fintech or payment systems is highly desirable, but candidates with s*trong* full-stack engineering experience in other demanding industries are also welcome.

What You'll Do

Full-Stack Application Development

- Design, develop, and maintain scalable web applications for fintech and payment services.
- Build responsive, accessible, and intuitive user interfaces using modern JavaScript and TypeScript frameworks.
- Develop backend services, REST APIs, and business logic supporting financial applications.
- Collaborate with designers and product managers to translate business requirements into reliable software.
- Take ownership of features from technical design through implementation, testing, and production release.
- Improve application performance, reliability, maintainability, and overall user experience.

Backend Engineering & API Development

- Design and implement backend services supporting user accounts, financial transactions, and payment workflows.
- Develop secure APIs for internal services and third-party integrations.
- Build asynchronous processing workflows for payment events, notifications, and transaction updates.
- Implement appropriate transaction validation, error handling, retries, and reconciliation mechanisms.
- Design efficient data models and database queries for financial applications.
- Integrate with payment gateways, banking APIs, identity verification services, and other financial technology providers.
- Contribute to service architecture decisions as the platform grows.

Frontend Engineering

- Build modern application interfaces using React, Next.js, and TypeScript or comparable technologies.
- Develop dashboards and user workflows for accounts, payments, transaction history, and financial reporting.
- Implement efficient state management and API communication patterns.
- Ensure frontend applications handle loading, failure, and transaction status changes clearly.
- Improve responsiveness, accessibility, and browser compatibility.

- Maintain reusable components and consistent frontend engineering practices.

Fintech & Payment Integrations

- Develop application features involving payment initiation, transaction processing, and payment status tracking.
- Integrate external payment providers and financial service APIs.
- Implement workflows for transaction histories, account balances, refunds, and financial reporting where applicable.
- Collaborate on systems requiring reliable financial data processing and reconciliation.
- Support secure handling of user and payment information.
- Participate in the development of digital asset and *blockchain*-enabled payment features when relevant.

Security, Reliability & Performance

- Apply secure coding practices across frontend and backend systems.
- Implement authentication, authorization, session management, and role-based access controls.
- Protect sensitive application data through appropriate encryption, validation, and access restrictions.
- Design reliable workflows that prevent duplicate financial operations and inconsistent transaction states.
- Write unit, integration, and end-to-end tests for critical application functionality.
- Investigate production issues, identify root causes, and implement sustainable improvements.
- Support application monitoring, logging, and performance optimization.
- Collaborate with infrastructure engineers on deployment reliability and operational security.

Technical Ownership & Collaboration

- Participate in architecture discussions and technical design reviews.
- Review code and help maintain high engineering standards.
- Mentor junior and mid-level engineers through practical technical guidance.
- Work collaboratively with backend, frontend, product, QA, and DevOps teams.
- Contribute to documentation, development workflows, and engineering best practices.
- Evaluate technologies and implementation approaches based on actual product needs.
- Help identify technical risks and recommend pragmatic solutions.

Required Skills & Experience

- 5+ years of professional software engineering experience, including substantial full-stack application development.
- Strong proficiency in JavaScript and TypeScript.
- Production experience with React, Next.js, or a comparable modern frontend framework.
- Strong backend development experience with Node.js, NestJS, Express, Java/Spring Boot, Go, Python, or a similar backend technology.
- Experience designing and developing RESTful APIs and integrating external services.
- Strong knowledge of relational databases such as PostgreSQL or MySQL.
- Experience with application authentication, authorization, and secure API development.
- Understanding of asynchronous processing, concurrency, caching, and distributed application patterns.
- Familiarity with Git, automated testing, code review, and CI/CD workflows.
- Experience building, deploying, and maintaining production applications.
- Ability to debug complex issues across frontend, backend, and database layers.
- Understanding of performance optimization, scalability, and software maintainability.
- Strong communication skills and ability to collaborate in distributed teams.
- Ability to take ownership of complex features and deliver maintainable, production-quality solutions.

Nice to Have (Differentiators)

- Previous professional experience in fintech, payments, banking, financial services, or digital asset platforms.
- Experience integrating Stripe, Adyen, Plaid, banking APIs, or other financial technology services.
- Understanding of payment processing, transaction reconciliation, settlement, and ledger systems.
- Experience with financial dashboards, transaction monitoring, or reporting applications.
- Knowledge of Redis, message queues, event-driven systems, or background job processing.
- Familiarity with Docker, Kubernetes, AWS, Azure, or Google Cloud.
- Experience implementing observability, tracing, monitoring, and alerting.
- Understanding of PCI DSS, payment security principles, or regulated financial environments.
- Familiarity with Web3 wallets, blockchain transactions, smart contract integrations, or digital asset payments.
- Experience with GraphQL, WebSockets, or real-time data applications.
- Experience contributing to platform architecture or mentoring other engineers.
- Background working in startups or early-stage product development environments.

Blockchain experience is not a requirement for this position. Strong full-stack engineers with experience building reliable financial or transaction-oriented applications are equally welcome.

Education

- Bachelor's or Master's degree in Computer Science, Software Engineering, Information Technology, or a related technical field.
- Equivalent professional experience and demonstrated engineering ability are equally valued.

What Success Looks Like

First 3 Months

- Understand the product goals, application architecture, and engineering practices.
- Become familiar with the frontend, backend, and integration layers.
- Deliver initial features and improvements with appropriate testing and documentation.
- Identify opportunities to strengthen application reliability, performance, and maintainability.
- Establish productive collaboration with the engineering and product teams.

Within 6 Months

- Independently deliver substantial full-stack features for financial applications.
- Contribute to backend API and frontend architecture improvements.
- Support reliable payment integrations and transaction processing workflows.
- Improve automated testing and development efficiency.
- Take ownership of important application components and help resolve production issues.

Long-Term

- Help build secure, scalable fintech and payment products.
- Contribute to architectural decisions as the engineering team expands.
- Improve system reliability and development processes.
- Mentor engineers and support a collaborative technical culture.
- Play a meaningful role in the evolution of the company's financial technology platforms.

Why Join Us?

- Help build new fintech and payment products at an early stage.
- Work on meaningful engineering challenges involving financial transactions, application security, and scalable software.
- Contribute to architectural and product decisions instead of focusing only on isolated development tasks.
- Collaborate with an international engineering team.
- Gain exposure to financial technology, digital assets, and blockchain-integrated applications.
- Work in a flexible, remote-friendly environment.
- Explore full-time, part-time, or contract collaboration based on mutual needs.

Ideal Candidate

We are looking for an experienced, product-minded full-stack engineer who enjoys building complete software solutions and taking responsibility for their quality.

You should be comfortable moving between frontend interfaces, backend APIs, databases, and third-party integrations while maintaining a strong focus on reliability and security.

We value practical engineering judgment, clear communication, technical ownership, and the ability to build maintainable software.

Experience with financial applications is an advantage, but we are equally interested in strong engineers from other industries who can apply their expertise to fintech and payment infrastructure.

The ideal candidate combines strong frontend and backend engineering skills with an understanding of production reliability, secure system design, and practical product development.
